

Stack CPU

Fetch Address Format

Where "Addr" comes from the PC, SP, or DR registers.

The value [BP] comes directly from the block pointer register (BP).

Fetch Sequence

[PC] is loaded into Fetch Address
Fetch Address output to memory
PROG data latched into Fetch Data
Fetch Data is sent to INST DEC

If INST DEC requires operand, then OP byte 1 and OP byte 2 are fetched. The OP bytes are routed to the appropriate register as dictated by the instruction.

If instruction requires transfer to/from DATA, then TBD.

If instruction requires transfer to/from STACK, then TBD.
